

Is solar photovoltaic power possible in China?

Some previous research has evaluated the geographic and technical potential of solar photovoltaic power in China (;), in which only some basic geographic and climatological factors such as land-use type, slope, and solar radiation are considered.

What is the capacity potential for large-scale solar PV in China?

4. Discussion This work reports that the total capacity potential for large-scale PV in China is 108.22 TW with 150.73 PWh annual solar PV generation (implying an average capacity factor of 15.9), which can bring 150.28 billion tones of CO₂ emission mitigation caused by coal-fired power generation.

What is the mass-to-power ratio of SHJ solar modules?

At the module level, the flexible SHJ modules are free from heavy glasses and back sheets (Supplementary Figs. 8 and 9), which results in an extremely small mass-to-power ratio of 2.31 g W⁻¹ that is much less than the values of 45.57 g W⁻¹ and 82.93 g W⁻¹ for standard monofacial and bifacial c-Si solar modules, respectively (Fig. 3f).

Will large-scale PV deployment contribute to China's net-zero electricity system by 2050?

The contribution of large-scale PV deployment to China's net-zero electricity system by 2050. As China has pledged to become carbon neutral by 2060, electrifying its energy sector is no doubt one of the priority measures to support the transition towards a more sustainable and decarbonized energy system.

Do flexible SHJ modules address load-bearing issues in building-integrated photovoltaics?

The flexible SHJ modules demonstrated in this study may address the load-bearing issue encountered in the fast-growing research field of building-integrated photovoltaics and enable c-Si solar modules to be attached to building walls with either flat or curved surfaces.

What is the photovoltaic performance of 65 mm & 55-mm devices?

The photovoltaic performance of the 65-mm and 55-mm devices is shown in Fig. 3c. The short-circuit current density (J_{sc}), open-circuit voltage (V_{oc}), fill factor (FF) and PCE are 37.65 \pm 0.09 mA cm⁻², 0.752 \pm 0.002 V, 82.40 \pm 0.99% and 23.31 \pm 0.33%, respectively, for the 65-mm device.
